

Peel & Stick Fabric Sheet Instructions

This fabric is for inkjet printers **only**. Do not use laser printers or color copying machines. The colorfastness of your fabric printout will depend on several factors including the total exposure to light, and the type of printer ink used.

- 1 Prepare image for printing on your computer.
 - Scan in a photo or other image.
 - Use a digital photograph.
 - Or create a design using software.
- 2 Prepare fabric for printing.
 - Flatten any curl that may be in the fabric by weighting the fabric sheet down overnight with books.
 - Trim any loose threads from the fabric. Do not pull them.
- 3 Prepare printer.
 - Adjust printer settings to plain paper (or thick paper if printer has this option) and best quality.
 - Different printers require different settings, so test your printout on paper before printing on fabric.
- 4 Remove all paper from tray, and insert fabric one sheet at a time. Print onto fabric side of sheet.
- 5 Let dry for 15 minutes after printing.
- 6 Cut out design if desired.
- 7 Peel off plastic backing. If the printed fabric sticks to itself, gently pull the two sides apart.
- 8 Press gently onto any smooth, clean surface. You can reposition at this point if necessary.
- 9 When your image is exactly where you want it, press it in place firmly.

Care Instructions

- Do not place in direct sunlight. The colorfastness of your image depends on how colorfast your printer ink is. All fabric will fade in direct sunlight.
- Store unused fabric flat, in original packaging. Keep out of humid conditions.

Tips

- Since printers do not print white, the white in your image will be the same color as the fabric sheet.
- You can snip off the corners of the leading edge of the fabric to help it feed through the printer.
- Try putting a blank sheet of paper in your paper tray, behind your fabric sheet, if your fabric sheet has trouble feeding through your printer.
